

Fix Log

Chatswood Chase Valet App — Everything asked and fixed, in plain English

9 August 2026

Checked how much internet data the app is using Done

WHAT WAS ASKED

Check how much internet data ("bandwidth") the app used since yesterday.

WHAT WE FOUND

Yesterday (8 August) the app used about 205 MB — more than half less than the 484 MB used the day before. For the whole month so far, the app has used less than 1% of the internet data we're allowed. Everything is healthy.

9 August 2026

Checked if more customers would slow things down or cost more data Fixed

WHAT WAS ASKED

If we get 10,000 customers, or 100 people a day using the hands-free shopping service with photos, will that use a lot more internet data?

WHAT WE FOUND AND FIXED

More customers alone is fine — that part was already built well. But photos (of shopping bags or cars) were being saved in a way that made each record much bigger than normal — like putting a full photo inside a text message instead of sending a link to it. If we start taking lots of photos every day, this would have slowly used up a lot more internet data. We fixed it: photos are now stored in their own separate place, and the record just keeps a small link to it. This keeps things fast and cheap no matter how many photos we take.

9 August 2026

Fixed old reports possibly missing information Fixed

WHAT WAS ASKED

Fix the issue where reports for older dates might not show everything.

WHAT WE FOUND AND FIXED

The app only keeps the most recent 2,000 cars ready to use on each device — older ones get quietly dropped to make room. If someone downloaded a report for an older date after we passed 2,000 total cars, it could have shown incomplete numbers with no warning. We fixed it: reports now double check they have everything for the dates you ask for, and if something's missing, they go get it before building the report. Nothing changed about how fast the everyday app feels.

9 August 2026

Made a simple summary of the day's fixes Done

WHAT WAS ASKED

Show the day's fixes as a PDF, written in plain English.

WHAT WE DID

Made a one-page PDF called "What We Fixed Today" explaining the two fixes above in simple words, and saved it in the app's folder.

9 August 2026

Set up this Fix Log Done

WHAT WAS ASKED

Keep one file that records everything asked, so it's easy to check what's already been asked or fixed.

WHAT WE DID

Created this Fix Log. From now on, every time something is fixed or added, a new entry is added here automatically — no need to ask.

9 August 2026

Made this Fix Log easy to read as a PDF Done

WHAT WAS ASKED

Turn this Fix Log into a PDF too, in plain English.

WHAT WE DID

Made a plain-English version of the Fix Log — same information, written in simple words, available as both a PDF and a webpage (this one). A fresh copy gets made every time something new is added.

9 August 2026

Tried to fix the printer not working for the first customer of the day Corrected

WHAT WAS ASKED

On the first customer check-in of the day, the key tag didn't print by itself — had to press the print button by hand. Felt like "the printer was cold".

WHAT WE FOUND AND FIXED

First guess was the wrong printer — a fix was made assuming the BIXOLON printer, but it turned out the printer actually being used is the Zebra one. That fix was kept anyway (it's harmless, just wasn't the real answer) — see the next entry for the actual fix.

9 August 2026

Fixed the printer not working for the first customer — for real this time (Zebra) Fixed

WHAT WAS ASKED

Correction: the printer that had the problem is the Zebra one, not BIXOLON.

WHAT WE FOUND AND FIXED

This same "cold start" problem had already been fixed for the Zebra printer once before, but it still happened again today. Checking with the user showed a clear pattern: the printer app was already open, and pressing print by hand worked straight away, first try. That tells us it wasn't the printer being switched off or the app not running — it was just the very first print request of the day having a one-off hiccup. So instead of trying to warm the printer up ahead of time (which clearly wasn't catching every case), the app now automatically tries again by itself, about a second later, if the very first print attempt fails — before showing any error to staff. Only if it fails twice in a row does it tell staff something's wrong. This should mean no more manual button presses for the first car of the day.

9 August 2026

Wrote up the process for selling the app to a new shopping centre Done

WHAT WAS ASKED

Write up the whole process for when a shopping centre wants to buy and use the app — what the user and their business partner need to do, as a PDF.

WHAT WE DID

Made "New Centre Playbook" — a step-by-step guide covering the sales conversation, agreeing business terms, setting up their own separate copy of the app, hardware, staff training, testing before launch, going live, and ongoing support. It also flags an important point: because every centre runs its own separate copy, any future fix has to be copied across to each one by hand, so it's worth keeping a list of every centre running the app.

9 August 2026

Found out why the text-message balance is running low, and fixed a hidden bug Fixed

WHAT WAS ASKED

Keep track of how much the text messages (SMS) to customers are costing per day — the account showed a low balance.

WHAT WE FOUND AND FIXED

The balance really is low — about \$4.93 left, and at the recent pace of spending (about 55 cents a day on average) that's roughly 9 days before it runs out. Along the way we also found a hidden bug: the tool that checks the text-message balance had been stuck for weeks showing very old messages from back in June, no matter when it was checked — so it looked fine when it wasn't really being watched properly. That's now fixed, and a new daily cost record has been started (like the internet-data one) so this can be tracked properly and topped up before it runs out.

9 August 2026

Stopped two cars being able to share the same parking bay Fixed

WHAT WAS ASKED

Staff found they could accidentally put two different cars in the same bay number.

WHAT WE FOUND AND FIXED

Two of the three ways staff can assign a bay already checked properly and blocked this. The third way — the quick "assign a bay" button on the dashboard — skipped that check. Fixed it to use the same check as the other two, so all three now block a bay that's already taken.

11 August 2026

Found and fixed the real reason internet data use crept up in recent weeks Watching

WHAT WAS ASKED

Keep tracking how much internet data the app uses, and see if we can get back onto Supabase's free plan instead of the \$25/month plan we're currently on.

WHAT WE FOUND AND FIXED

One day this week used far more data than usual (about 385 MB). Digging deeper, the real story wasn't that one day — it's something that's been quietly happening for weeks: every time a staff phone or tablet wakes up, switches apps, or its connection drops and reconnects, the app was re-downloading the entire list of cars from scratch, even when almost nothing had changed. That happens a lot during a shift, so it added up fast. Fixed it so the app only downloads what's actually new or changed, plus a small check for anything deleted — cutting each of those re-downloads by roughly 80-100 times. Tested directly against the real data: about 2 MB down to about 28 KB per check. Still waiting to see a full day's real number before deciding whether to switch back to the free plan.

11 August 2026

Set up an automatic version of this Fix Log

Done

WHAT WAS ASKED

How can this log keep itself updated automatically every time something gets fixed or added?

WHAT WE DID

Turned the "add an entry every time something's fixed" habit into a proper, saved rule that travels with the app's files — so it happens the same way every time, in any future session, rather than relying on being remembered.

11 August 2026

Added a way to track "did this actually work?"

Done

WHAT WAS ASKED

How can I follow up later on what got fixed, to check it actually worked?

WHAT WE DID

Added a "still watching" section to the log for anything that was fixed but needs a bit more time — like a day of real use — to be sure it actually worked. Once it's confirmed, it gets marked off and moved out of that section.

11 August 2026

Found and fixed why data use was still high, hours after the earlier fix

Fixed

WHAT WAS ASKED

Today's data use still felt too high, especially since no staff were actively using the app.

WHAT WE FOUND AND FIXED

Checked the raw records directly and found the old, expensive way of re-downloading the whole car list was still happening every 1-3 minutes, hours after the fix went live. The reason: a website like this one doesn't automatically update a screen that's already open — only a fresh reload picks up the new version. So any screen (a desk computer, the print station, a phone) that was already open before the fix went live kept quietly running the old, expensive version. After asking for a hard refresh on the affected screen, checked again and confirmed the old expensive pattern had completely stopped.

11 August 2026

Added a "who's online" indicator Done

WHAT WAS ASKED

Can I have a feature showing how many staff are online at the same time?

WHAT WE DID

Added a small indicator in the top corner showing how many staff are currently connected. Tap it to see a list of every connected device and how long each one has been open — which is also handy for spotting a screen that's been sitting open too long and needs a refresh.

11 August 2026

Made the "who's online" indicator admin-only Done

WHAT WAS ASKED

Only admin-level staff should be able to see who's online.

WHAT WE DID

Regular staff devices still quietly check in behind the scenes so the count stays accurate, but only admin accounts can actually see the indicator on screen.

11 August 2026

Tracked down why "who's online" wasn't showing up at all Fixed

WHAT WAS ASKED

Still can't see how many staff are online, even after refreshing.

WHAT WE FOUND AND FIXED

Testing directly against the system (separate from the app itself) found two real, separate problems. First, a security setting meant to control who can use the app's "live updates" system had accidentally been left in its strictest state — blocking ALL live updates of this type for everyone, including the feature that lets one phone ask the print station to print a tag. Fixed that with a proper access rule. Second, even after that fix, the specific piece used for "who's online" still didn't work — traced to an old, outdated version of the underlying toolkit the app relies on, which had a genuine bug in that exact feature. Confirmed a newer version fixes it, tested it thoroughly against everything else the app depends on (accounts, saved data, photos, live updates) to make sure nothing else would break, then safely updated to the newer version.

11 August 2026

Found a separate, unrelated login problem while testing

Found, not yet fixed

WHAT WAS ASKED

N/A — found while checking the fix above on a real device.

WHAT WE FOUND

One device showed a warning that the cloud returned no cars. The real cause: the behind-the-scenes list that lets a device quietly stay logged in for 24 hours without re-entering a PIN is currently completely empty — most likely from something unrelated that happened earlier. That device still looks logged in on screen, but can't actually talk to the cloud properly until it's logged in fresh. The fix is simple — log out and log back in with your PIN — but that step hasn't been done yet, so this is flagged as still open.

11 August 2026

Checked internet data use again

Done

WHAT WAS ASKED

Check how much internet data the app has used today.

WHAT WE FOUND

About 197 MB so far today — still under 1% of the monthly allowance. The rise since the last check earlier today is from the troubleshooting work itself (repeatedly pulling the full car list to test the problem above), not a new leak.
