

Fix Log

Chatswood Chase Valet App — Everything asked and fixed, in plain English

9 August 2026

Checked how much internet data the app is using Done

WHAT WAS ASKED

Check how much internet data ("bandwidth") the app used since yesterday.

WHAT WE FOUND

Yesterday (8 August) the app used about 205 MB — more than half less than the 484 MB used the day before. For the whole month so far, the app has used less than 1% of the internet data we're allowed. Everything is healthy.

9 August 2026

Checked if more customers would slow things down or cost more data Fixed

WHAT WAS ASKED

If we get 10,000 customers, or 100 people a day using the hands-free shopping service with photos, will that use a lot more internet data?

WHAT WE FOUND AND FIXED

More customers alone is fine — that part was already built well. But photos (of shopping bags or cars) were being saved in a way that made each record much bigger than normal — like putting a full photo inside a text message instead of sending a link to it. If we start taking lots of photos every day, this would have slowly used up a lot more internet data. We fixed it: photos are now stored in their own separate place, and the record just keeps a small link to it. This keeps things fast and cheap no matter how many photos we take.

9 August 2026

Fixed old reports possibly missing information Fixed

WHAT WAS ASKED

Fix the issue where reports for older dates might not show everything.

WHAT WE FOUND AND FIXED

The app only keeps the most recent 2,000 cars ready to use on each device — older ones get quietly dropped to make room. If someone downloaded a report for an older date after we passed 2,000 total cars, it could have shown incomplete numbers with no warning. We fixed it: reports now double check they have everything for the dates you ask for, and if something's missing, they go get it before building the report. Nothing changed about how fast the everyday app feels.

9 August 2026

Made a simple summary of the day's fixes Done

WHAT WAS ASKED

Show the day's fixes as a PDF, written in plain English.

WHAT WE DID

Made a one-page PDF called "What We Fixed Today" explaining the two fixes above in simple words, and saved it in the app's folder.

9 August 2026

Set up this Fix Log Done

WHAT WAS ASKED

Keep one file that records everything asked, so it's easy to check what's already been asked or fixed.

WHAT WE DID

Created this Fix Log. From now on, every time something is fixed or added, a new entry is added here automatically — no need to ask.

9 August 2026

Made this Fix Log easy to read as a PDF Done

WHAT WAS ASKED

Turn this Fix Log into a PDF too, in plain English.

WHAT WE DID

Made a plain-English version of the Fix Log — same information, written in simple words, available as both a PDF and a webpage (this one). A fresh copy gets made every time something new is added.

9 August 2026

Tried to fix the printer not working for the first customer of the day Corrected

WHAT WAS ASKED

On the first customer check-in of the day, the key tag didn't print by itself — had to press the print button by hand. Felt like "the printer was cold".

WHAT WE FOUND AND FIXED

First guess was the wrong printer — a fix was made assuming the BIXOLON printer, but it turned out the printer actually being used is the Zebra one. That fix was kept anyway (it's harmless, just wasn't the real answer) — see the next entry for the actual fix.

9 August 2026

Fixed the printer not working for the first customer — for real this time (Zebra) Fixed

WHAT WAS ASKED

Correction: the printer that had the problem is the Zebra one, not BIXOLON.

WHAT WE FOUND AND FIXED

This same "cold start" problem had already been fixed for the Zebra printer once before, but it still happened again today. Checking with the user showed a clear pattern: the printer app was already open, and pressing print by hand worked straight away, first try. That tells us it wasn't the printer being switched off or the app not running — it was just the very first print request of the day having a one-off hiccup. So instead of trying to warm the printer up ahead of time (which clearly wasn't catching every case), the app now automatically tries again by itself, about a second later, if the very first print attempt fails — before showing any error to staff. Only if it fails twice in a row does it tell staff something's wrong. This should mean no more manual button presses for the first car of the day.
